Problem Statement:

College students currently do have tools to manage their academics and mark deadlines, but they generally don't have the ability to help analyze workload, prioritize tasks, and monitor academic performance from a single dashboard.

Idea:

I want to make a complete dashboard for all academic management, specifically for Purdue students. It will have the ability to track courses, monitor and visualize performance, and organize their upcoming workload.

Tech Stack:

Language: Python
Libraries/Packages: pandas, Plotly, datetime
Data Storage: SQLite database
External Data: N/A

Target Milestones:

1) Set up Git repo and local environment.
2) Create SQLite database, implement basic database functions(add, get, update, delete).
3) Create a course/assignment manager.
4) Implement assignment Eisenhower matrix.
5) Implement a dashboard on the frontend and integrate all features.
